

Lagoon Corporation

P.O. Box 696, Farmington, UT 84025

Lagoon Corporation has failed to meet minimum federal standards for the care of animals used in exhibitions as established in the Animal Welfare Act (AWA). The U.S. Department of Agriculture (USDA) has cited Lagoon numerous times for filthy enclosures, inadequately trained employees, failure to provide sick and dying animals with veterinary care, and failure to provide animals with adequate space. Lagoon has had a high death rate and several unexplained deaths. Contact PETA for documentation.

August 18, 2013: A Lagoon employee was injured in an animal enclosure and hospitalized in serious condition. The facility was not very forthcoming with information, and on August 21, 2013, according to the Associated Press, the Farmington fire chief stated that the employee had been gored in the leg while she was feeding a black wildebeest.

July 10, 2012: According to the (Ogden, Utah) *Standard-Examiner*, the USDA cited Lagoon for having water bowls inside an elk pen that were encrusted with dirt and algae.

September 27, 2011: The USDA cited Lagoon for failure to provide two leopards with adequate veterinary care. In contradiction to its parasite-control program, the facility failed to retest the cats for parasitic infection after they tested positive for parasitic nematode worms and were given treatment.

September 27, 2006: The USDA cited Lagoon for failure to provide kangaroos with adequate veterinary care. The inspector wrote that “information on the health problem which led to the euthanasia of the adult female kangaroo on 7-22-06 has still not been conveyed to the kangaroo’s attending veterinarian.” The investigator added that such information was necessary to “ensure that the remaining kangaroos receive adequate care including any possible measures to prevent a reoccurrence.”

May 4, 2004: The USDA cited Lagoon for not correcting a previously identified violation for failure to provide adequate veterinary care. The inspector determined that animal “[h]ealth problems are not being detected, diagnosed and treated” and cited

several examples. A peccary’s eyes were both “encrusted with amber colored material.” At various times, a camel was observed to have a lump on his face and an abscess and a lump on his lip, and there was no evidence that he had received treatment. Numerous animals were in need of hoof trimming, including a fallow deer whose hooves were “at least 4 inches long” and a peccary who had “overgrown front claws bilaterally that turned up on the tips.” A cougar, a camel, a fallow deer, and a peccary were observed limping. The inspector also wrote that health records were missing vital information. For example, there was no record of the dosage of a medication for an unidentified animal. Lagoon was also cited for failure to maintain facilities—the fencing for 12 bison was noted to contain protruding wires near ground level, one of which was approximately 10 inches long and formed a loop. The inspector expressed concern that the bison could “get a leg caught in loops of wire and potentially break a leg or injure themselves.” Lagoon was also cited for failure to provide a sufficient number of adequately trained employees. The inspector wrote, “It is evident that the facility lacks employees and a supervisor who are adequately trained to maintain the professionally acceptable level of husbandry practices.” The inspector also wrote that despite being told by two USDA veterinarians that several animals’ hooves needed immediate attention, the supervisor didn’t agree that hoof care was needed. The inspector observed, “It appears that the facility does not understand the importance of proper hoof care in preventing lameness.” The inspector also noted, “The facility needs to evaluate whether they have appropriate facilities to provide safe handling conditions for the fallow deer when they provide the needed hoof trimming. ... There have been anesthetic deaths and injuries (a fractured tibia and a ruptured tendon) from darting in the past when the fallow deer were worked without appropriate facilities.”

March 19, 2004: The USDA cited Lagoon for not correcting a previously identified violation for failure to provide adequate veterinary care. The facility couldn’t produce documentation that the attending veterinarian had visited the site every two weeks, as prescribed by the program of veterinary care. It also couldn’t provide documentation of applicable and complete deworming treatments for hoofstock. Lagoon was also cited for failure to provide adequate drainage in a muntjac deer enclosure. It was observed to be covered in “muck ranging from 2 to 5 inches deep which exudes a strong excreta odor,” and the animals were forced to stand in the muck in order to reach the feeder in the enclosure. The inspector also wrote that Lagoon failed to provide 10 bison with water. The inspector also noted that the somewhat overgrown front toe of a fallow deer had been pointed out to a facility representative.

October 4, 2002: A USDA inspector noted that the evaluation of the deaths of a young zebra, a muntjac deer, and three Corsican sheep who died in late 2001 had not yet been completed and that two elk, four Corsican sheep, and one fallow deer would need more shelter space in the next two to three weeks.

July 6, 2001: In a letter to Lagoon, the USDA warned the facility that keepers must carefully observe newborns to ensure that they nurse. Lagoon was encouraged to develop a more effective husbandry program for neonatal animals following the deaths of a newborn elk calf and a fallow deer fawn.

April 19, 2001: The USDA cited Lagoon for not correcting a previously identified violation for failure to maintain records of acquisition and disposition. There were no disposition records for 11 fallow deer who were no longer at Lagoon and two buffalo who were sold to an individual for slaughter, as well as other animal transactions. The USDA also cited Lagoon for failure to provide elk with shelter from direct sunlight and inclement weather.

August 28, 2000: The USDA cited Lagoon for failure to maintain records of acquisition and disposition for animals who died or were born during the year.

July 20, 2000: The USDA cited Lagoon for failure to provide adequate veterinary care. A buffalo cow underwent surgery on May 2, 2000, to remove a rubber band embedded around a toe. The animal didn't receive sufficient follow-up care and developed an infection. On June 1, 2000, it was determined that the infection was spreading up the leg, and the animal was euthanized. The inspector also found outdated medication and dirty needles used for injections. Lagoon was also cited for improper animal handling. The public had access to animals without the presence of a trained employee. The inspector also noted that necropsy reports for a fallow deer who had died and a stillborn elk were not available.

March 30, 2000: The USDA cited Lagoon for failure to comply with its veterinary-care program—a peccary hadn't received testing or treatment for parasites. Lagoon was also cited for failure to provide complete information for two recently purchased camels. The inspector noted that a camel died on March 5, 2000, from peritonitis associated with a perforated ulcer and that the facility hadn't provided its employees with outside training.

September 16, 1999: The USDA cited Lagoon for failure to provide the inspector with documentation addressing the problem of inadequately trained employees.

August 2, 1999: The USDA cited Lagoon for not correcting previously identified violations for failure to provide adequate veterinary care and employing inadequately trained staff. A camel exhibiting sweatiness and labored breathing was down for 12 hours and never received veterinary care. The animal died of peritonitis subsequent to a perforation in the digestive tract. The inspector also wrote that several elk remained thin, with protruding ribs. Nutritional supplements prescribed by the veterinarian weren't being fed to the animals.

June 29 and 30, 1999: The USDA cited Lagoon for not correcting previously identified violations for failure to provide adequate veterinary care, for filthy enclosures, and for inadequately trained employees. A newborn fallow deer was never observed nursing and died 37 to 38 hours after birth. Several elk remained thin, with protruding ribs and hair loss. There was no record of deworming, routine tests for intestinal parasites, or vaccinations for the elk. The sheep enclosure had a high concentration of feces. The inspector directed Lagoon to conduct necropsies on any subsequent deaths to "facilitate herd health management and to assure adequate veterinary care."

May 12, 1999: The USDA cited Lagoon for not correcting a previously identified violation for failure to provide adequate veterinary care. The male lion, Rhondo, died on April 18, 1999. A necropsy found complete bowel blockage. He had suffered from vomiting, weakness, shallow breathing, sticky feces, nasal discharge, a dry and matted coat, and thick, dry lips. He also couldn't swallow medications. Employees failed to recognize the severity of his condition or accurately communicate his symptoms to the veterinarian. Failure to have adequately trained employees and a procedure to obtain emergency veterinary care contributed to Rhondo's death.

April 8, 1999: The male lion identified as needing veterinary care during an April 2, 1999, inspection was suffering from anemia, arthritis, and abnormal kidney function. Lagoon was cited for repeatedly failing to develop a veterinary-care plan to address deficient capture and anesthesia procedures and the poor health of elk.

April 2, 1999: The USDA cited Lagoon for not correcting previously identified violations for improper feeding, filthy enclosures, and failure to provide adequate veterinary care. Lagoon failed to develop a veterinary-care plan to address deficient capture and anesthesia procedures and the poor health of elk. Lagoon was cited for failure to provide a lion with veterinary care. The inspector wrote that Rhondo "was thin to the point that the ribs and hip bones were

prominent. He was weak and had difficulty walking or even standing. ... He was observed writhing for a period of time and then vomited at least a cup of yellow-green fluid His tongue appeared pale There were no [records] ... indicating that the animal's deteriorating condition has been noticed." The inspector also noted that dead-animal disposal must comply with all applicable regulations.

February 8, 1999: The USDA cited Lagoon for failure to provide adequate veterinary care after four fallow deer died because of anesthetics or poor darting techniques employed during tranquilizer use. The facility also had outdated medication, and seven elk in "a very small pen" appeared thin and had rough hair coats. The inspector recommended routine necropsies because of a high death rate and unexplained deaths. Lagoon was also cited for feeding moldy hay, which can contain toxins, to camels, sheep, and deer and placing a mineral block on the ground where there was fecal contamination. Lagoon was again cited for failure to provide seven elk with sufficient space. A zebra and her 7-month-old baby as well as 16 Corsican sheep also weren't provided with adequate space. Lagoon was cited a sixth time for filthy enclosures. The inspector wrote, "Excessively soiled bedding has been a chronic problem at this facility."

October 16, 1997: The USDA cited Lagoon for inadequate drainage that caused elk to "stand in the muck" while eating, enclosures that were filthy with an excessive accumulation of waste, and failure to record the death of a cougar in its disposition records.
